

The researchers suggest the virus may have mutated to have a furin cleavage site

"The matching code may have originally been introduced to the Covid genome

through infected human cells expressing the MSH3 gene," wrote Dr Balamurali

At the same time, the team also claimed that there is a one-in-three-trillion chance

"We're talking about a very, very, very small piece made up of 19 nucleotides,"

Professor Lawrence Young, a virologist at Warwick University, was quoted as
